

WDV353 : Server-Side Languages

The Server-Side Languages course examines how web applications store and process information that is consumed by various client endpoints. In this course, students will learn how to connect and integrate data from external sources and how front-end programs consume these services to develop a more robust web application. By implementing server-side development frameworks, students will be able to deploy synchronous and asynchronous client communication through standards-compliant protocols. They will also examine user session persistence and its relationship to a web application's scalability.

Credits 4

Course Length 4 weeks
